Hello Everyone!

Happy summer break! I'm so excited for cross country this fall, and what better way to prepare than to spend the whole summer training! Linked in the TL;DR are the 3 training plans, **but before you find your plan please** read the general tips/details below.

General Details:

Workout Structure:

I have given the training plans with days not specified. I would recommend putting 1-2 days between workouts (including long runs). If you need to put workouts on back-to-back days, do the workout 1 before workout 2 (workout 2 is always a threshold). Never do a long run the day before a workout. You can use this handy dandy [pace calculator for your workouts!](#)

Adjusting mileage (peaking somewhere between plans)

Find the plan closest to your mileage (ie the 45 plan if you want to peak at 50), and either add or subtract 1 mile/1-2 reps to each workout and run, depending on if the plan is greater or less than your preferred mileage. Please email or text me for support, I can do this for you.

Custom Plans

For anyone who wants to go higher than 60, or just wants a more specialized plan, I am happy to help! Please email or text me and I will work with you to make the best possible training plan for you

Strides:

Strides are the most important thing you can do to keep your track speed throughout cross country! For our purposes, strides are 4-6 x 100 meters, focusing on staying relaxed while building up to top speed at about 60 meters in, holding that for 20 meters, and decelerating to 100.

Hill Workouts:

Every hill workout has the same form: some number of 200 meter hills and a tempo component. You should find a shallow hill (3-5%) and run at about mile pace effort up, and jog down. For those doing more reps, I like to walk down after the halfway rep. After

your last hill, take 3-4 minutes, and then go straight into the tempo component—this may require some easing in as your body adjusts. **Please** don't skip the tempo; it is one of the easiest ways to build fatigue resistance for the latter half of xc races.

Long runs:

Except for the first couple long runs, long runs should be a quality effort. The two main ways of doing this are a progression (dropping xx seconds each mile), or a steady (holding at about 30-45 seconds faster than easy run pace). I'd also like people to incorporate either 4 x 1 minute hard, 1 minute jog, or 5 minutes hard at the end of their long runs—again for fatigue resistance benefits.

Long Run Fueling:

For those going more than 90 minutes, I would recommend taking a gel or drink mix during your run. Everyone should eat something right after they finish.
